

Picture	Name & Notation	Definition	Additional Info
	POINT Point <i>A</i> (1 Letter only) <i>UPPERCASE</i>	* A point is an undefined term. It can be described as a dot or location. It does not have a size, therefore, has no dimension.	
	LINE  <i>BC</i> or <i>line m</i> (2 Letters) <i>UPPERCASE</i>	* A line is an undefined term. A line can be described as a series of points that extend in 2 opposite directions. It never ends. It has one dimension.	Through one point, there are infinite lines. Through 2 points, there is <u>exactly one line</u> . 
	PLANE plane <i>K</i> (<i>K</i> is not a point) or plane <i>ABC</i> (3 or more Letters) <i>UPPERCASE</i>	* A plane is an undefined term. A plane can be described as a flat surface without thickness. It is never-ending. It has two dimensions.	Through any 3 points not on the same line, there is <u>exactly 1 plane</u> .
	SEGMENT <i>LH</i> or <i>HL</i> (2 Letters)	A line segment is part of a line with 2 endpoints.	
	RAY <i>NE</i> * (2 Letters and the order matters!) *	A ray has 1 endpoint on one side and an arrow that never ends on the other side.	* <u>First letter is the endpoint, second is the direction.</u>

Bisector (divides a segment in half)

$$AM = MB$$

More Vocab

Collinear points

3 or more

points that lie on the same line.

example:

A, B, C, D

Coplanar Points

points that lie in the same plane.

example:

Opposite Rays

2 rays extending in opposite directions connected at a common endpoint. They form a line

example:

$\overrightarrow{BC}$ and $\overrightarrow{BD}$
OR
 $\overrightarrow{BA}$

Sketches

2 intersecting lines

plane and a line in the plane

plane and line intersecting a plane at a point

2 intersecting planes
